## **ABSTRACT**

The coastal areas of Bangladesh, particularly the southeast region, is notorious for producing a majority of dried fish products in the country by recruiting numerous dry fishers and wholesalers (locally called *Mohajon*). This study examines the socio-economic condition and livelihood status of small scale dry fish producing communities in Nazirartek, a renowned fish drying village situated in

\*Corresponding author: Email: [roksana.mfog@sau.edu.bd](mailto:roksana.mfog@sau.edu.bd);

Cox's Bazar, Bangladesh. It was perceived that the dry fishers lived in a very underdeveloped state with low income and literacy rates, poor living standards and malnourished condition, whereas the livelihood of wholesalers was comparatively better. The inadequate compensation during rainy seasons was another reason for the unimproved livelihood of the fishers. Because of this, they had to take up substitute agricultural or other occupations during the off-seasons of fish drying activities. Majority (60%) of the wholesalers had attended secondary school, considering 56.66% fishers went up to primary school with no further secondary school education. Furthermore, over 50% fishers had an annual income of 81,000 to 100,000 BDT while 70% wholesalers earned above 100,000 BDT year<sup>-1</sup>. Primarily, the major constraints encountered by the communities are vulnerability to extreme weather, reliance on loans due to low wages, inadequate off-season income opportunities, lack of good treatment facilities, no prior training and scarcity of technological facilities. With appropriate management strategies, comprehensive marketing systems, national co-operation and employment opportunities, the dry fishing industries of Bangladesh can be developed to its' full potential.

*Keywords: Dry fishers; wholesalers; socio-economic condition; livelihood status; cox's bazar.*

## 1. INTRODUCTION

Fisheries management governs the different fishing activities of a community, such as who fishes, when and where fishing takes place, what is or isn't fished [1]. Surveying the socio-economic dimensions of a particular fisheries community postulates the outcome of the existing fisheries management and how the stakeholders of that community are coping with it. Moreover, the purpose of socio-economic and livelihood evaluation is to understand if the management objectives of fisheries improvement projects are being met for the well-being of small scale fishers and gaining knowledge for the establishment of policy-making [2]. It also helps to understand the steps to be taken or specific adaptations to be made for the progress of social, biological and economic development of community-based fisheries. An impoverished livelihood and poor demographic of the fishing communities indicates that the implemented management strategies are in need of improvement. Research on the socio-economic condition of the fishing communities and the livelihoods of individual dry fish producers in coastal areas are limited in Bangladesh. Consequently, different organizations and the Government can implement certain policies and management approaches to improve the living condition of dry fish producers and other stakeholders. Dried fish processing and marketing instigate in the socio-economic and nutritional sector of the country, contributing to the increase of food production, diversifying the economy and creating employment opportunities [3].

The socio-economic condition, which is inseparable from the geographic-ecological condition of coastal areas, influences certain characteristics of the people [4]. It paints a picture of the living status of dry fish producers and wholesalers that is directly influenced by their level of education, health, fishing experience, number of earning family members, alternate income source and other factors. The most common obstacles encountered in coastal areas are high poverty level, degradation of natural resources, land use conflict and low village and health infrastructures in the region. Thus, coastal communities are vulnerable to these adverse conditions, leading to a sluggish socio-economic development.

Livelihood consists of different types of assets, capabilities and activities for the means of living and it can be called sustainable when people are able to adapt to adverse conditions and at the same time retain their assets or capabilities as they continue to lead a sustainable life [5]. More than 12% of total population of the country directly or indirectly are dependent upon the fisheries sector for their livelihood. The nature and characteristics of the coastal communities are strongly influenced by seasons, their livelihood, activities related to fisheries and agriculture, their fishing effort and other such factors [6]. In spite of the growing industry, the means of living of fish producers are quite poor, as their condition is influenced by not only the economy but also the climate and extreme weather conditions in the coastal region. Bangladesh is effected by about 40% of total storm surges in the world [5] and the livelihood of

the coastal communities is highly vulnerable to environmental damage [6].

The Fisheries sector is an important aspect to be considered in terms of the development of the socio-economic condition of Bangladesh. The livelihood and socio-economic conditions should be taken into consideration for the development of future national policies and strategies. At present, there are still challenges to overcome in case of the development of coastal communities. Such constraints include- dry fish producers not getting enough compensation during the off-seasons and banning period, unable to create standard alternate employment opportunities or take loans, low wages of labors, low availability of infrastructures and training facilities, extreme poverty, inaccessibility of improved medications which leads to deteriorating health and any other contributing factors. This analyses the livelihood condition and socio-economic status of dry fish producers and wholesalers and assesses the outcome of current fisheries management as well as provides implications on Sustainable Development Goals (SDG) at Nazirartek, Cox's Bazar.

## 2. MATERIALS AND METHODS

### 2.1 Study Area

The study was conducted at Nazirartek, largest fish drying area located in the western side of Cox's Bazar district of Bangladesh. The fish drying village is also known as 'Shutki Polli'. The area occupies about 200 acres of land on the estuary of Bakkhali river (Fig. 1).

There are approximately 1,500 dried fish producers and 20,000 laborers working at Nazirartek. Activities related to marine fisheries are seasonal [7] and the process of preparing dried fish starts from October and, with favorable weather condition, continues till February/March next year. Different fish species are used for drying including Largehead hairtail (*Trichiurus lepturus*), Bombay duck (*Harpodon nehereus*), Bigeye croaker (*Pennahia aenea*), Indian threadfin (*Leptomelanosoma indicum*), Indian pike conger (*Congresox talabonoides*), Dorab wolfherring (*Chirocentrus dorab*), Black tiger shrimp (*Penaeus monodon*) etc.

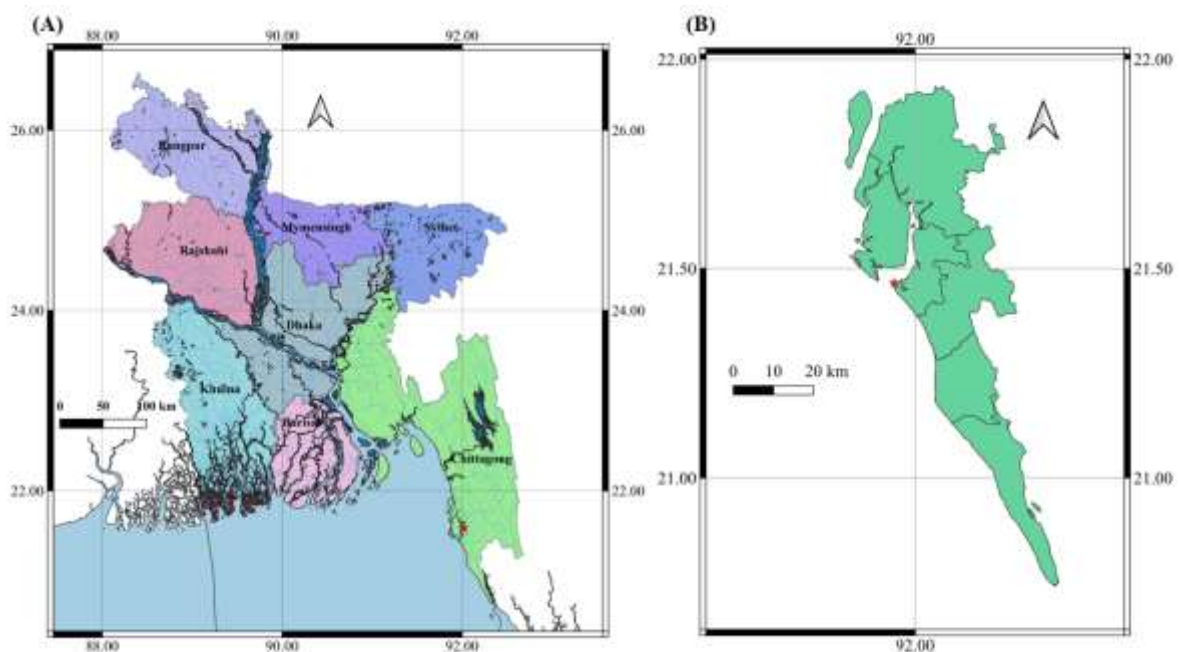

Fig. 1. Map showing the study areas, (A) the entire Bangladesh, (B) the district of Cox's Bazar with Nazirartek

**Fig. 2. Research design used for current study**

## 2.2 Data Collection

Fundamental data was collected from January to May of 2021, on social class, income, familial background, academic and financial status, living patterns, activities, sanitation, facilities and existing problems, using pre-prepared questionnaires with checklists including field visits, cross-check interviews and focus group discussions (FGD) (Fig. 2). Randomly selected respondents included 30 dry fishers or labors and 10 wholesalers (Mohajon) working at Nazirartek. Two sessions of interviews and FGDs were conducted, maintaining social distance and WHO protocols as the study was conducted right after the covid-19 pandemic, with 10-15 respondents in each session. Each session took about 1-2 hours.

## 2.3 Statistical Analysis

Collected data were transferred to an excel sheet in terms of socio-economic and occupational profiles and analyzed for frequencies separately. The correlation among age, fishing experience and income was analyzed using Pearson correlation. The significant level was considered at  $p > 0.01$ .

## 3. RESULTS

### 3.1 Comparative Features of Socio-economic Dimensions between Dry Fishers and Wholesalers at Nazirartek

60% of dry fishers were of young age (<35 years), whereas 30% and 10% of fishers were middle and old aged, respectively (Table 1). In contrast, most of the wholesalers were between middle (60%) and old aged (40%). The contribution of female (86.66%) in drying activities were comparatively high than male (13.33%). Most of the contribution were observed as netting, fish beheading, gutting, salting, drying and other related pursuits. All person in dry fishers and wholesalers were Muslim. 63.33% of dry fishers had single family, whereas 80% of wholesaler had joint family. 46.66% of dry fishers had small-size family (2-3 members), followed by 30% and 23.33% of fishers were

medium (4-5 members) and large-size family (6-7 members) (Fig. 3A). 80% of wholesalers had medium-sized family with 4-5 members (Table 1, Fig. 3B). 50% of fishers and 80% of wholesaler had one earning family members.

The educational status of the wholesalers was found superior compared to the labors' community. 60% of wholesalers attended secondary school (Table 1, Fig. 3D), whereas 56.66% of fishers went to primary school with no further secondary school education (Fig. 3C). 60% of wholesaler had school going children, whereas 50% of the fishers had school going children. 100% of both fishers and wholesaler had ordinary status in the community. The fish drying community were not involved in any political work or had any local leaders. About 63.33% of dry fishers lived in tin shade housing, whereas all of wholesaler lived in half-cemented housing.

46.66% of dry fishers used their own tube-well while 53.33% used their neighbor's tube-well whereas 80% of the wholesaler respondents used their own tube-well. The sanitary condition was not any better in the communities as 43.33% and 40% labors used unimproved and semi-improved toilet respectively. Although 60% of wholesaler used semi-improved toilet followed by 40% unimproved toilet. The majority of fishers (90%) and wholesaler (100%) were infected non-infectious disease.

### 3.2 Comparative Features of Occupational Factors between Dry Fishers and Wholesalers at Nazirartek

63.33% of dry fishers had 1-5 years of drying experience, followed by 23.33% with 6-10 years, 3.33% with 11-15 years, 6.66% with 16-20 years and 3.33% with more than 20 years' experience (Table 2). On the other hand, 30% of wholesaler had 11-15 years of experience, 20% had 16-20 years and 50% had more than 20 years of experience (Table 2). 56.66% of fishers earned 81,000-100,000 BDT year<sup>-1</sup>, 20% earned above 100,000 BDT year<sup>-1</sup>, 13.33% earned 40,000-60,000 BDT year<sup>-1</sup> and 10% earned 61,000-80,000 BDT year<sup>-1</sup>. In contrast, 70% of

wholesaler earned above 100,000 BDT year<sup>-1</sup> and 20% earned 81,000-100,000 BDT year<sup>-1</sup>. The expenditure rate for the wholesaler was revealed to be half and half with 50% on fisheries and 50% on household activities (Table 2). Only 6.66% of fishers could save money and about 60% of wholesalers were able to save money.

Source: Authors survey, 2021

Beside the main professions, the dry fishers involved with agriculture (16.66%), animal rearing (16.66%) and others (10%). Wholesaler did not have any secondary occupation. The

majority (76.66%) of dry fishers did not have any prior training and 23.33% had received training from government organizations. All wholesaler also had received government training. No one

had any training from any NGOs (Table 2). 70% of fishers took loan from NGOs followed by 30% from the bank. 50% of wholesaler took loan from NGOs and 50% from the bank. 36.66% of fishers took loans for the purpose of restoring and fixing their houses due to tidal surges in the coastal areas, 30% took loans for other occupations, 20% for fisheries activities, 10% for health, 6.66% for education and 6.66% for marriage. 40% of wholesaler took loan for the purpose of fulfilling fisheries related activities, 40% for housing purposes, 10% for marriage and 6% for health (Table 2).

### 3.3 Correlations between Age, Experience and Income of Dry Fishers and Wholesalers at Nazirartek

Pearson correlation among factors such as age, fishing experience and income in dry fishers and wholesalers were observed in Table 3. For dry

fishers, age was positively significantly correlated with experience, whereas age was also negatively related with experience for wholesalers. Income had positive insignificant relation with age and experience for fishers and wholesalers (Table 3).

### 4. DISCUSSION

Small-scale fishers are one of the major vulnerable communities in Bangladesh [8]. Even though the occupation of fish drying has brought economical security to many people living in the rural coastal communities, there are many arising problems and constraints revolving around their subsistence. The socio-economic livelihood of the fishers and wholesalers is deeply influenced by their income, fishing experience, number of earning members, savings and loan. It was observed that due to their small income, the fishers faced many obstacles accessing the

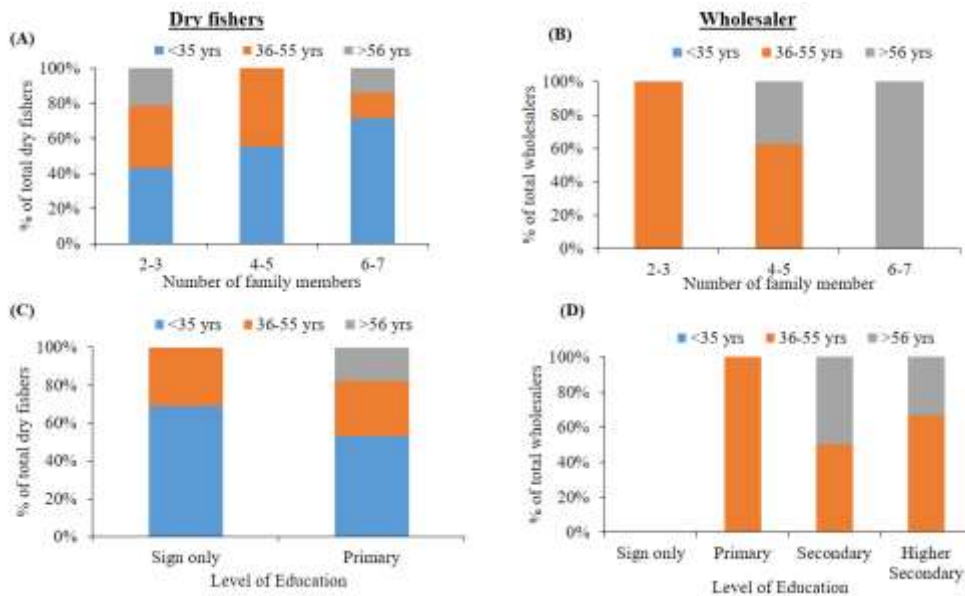

Fig. 3. Comparative features between (A) the number of family members and (C) level of education of dry fishers with age. Comparative features between (B) the number of family members and (D) level of education of wholesalers with age

Table 3. Pearson correlation between age, experience and income of dry fishers and wholesalers in the Nazirartek, Cox’s Bazar, Bangladesh during 2021

\*\*Correlation is significant at the 0.01 level (2-tailed)

basic necessities in their daily lives and were unable to have an improved livelihood. In Nazirartek, the majority of dry fishers had comparatively lower income (<10,000 BDT month<sup>-1</sup>). Similar results were observed in Kuakata, Barisal and Cox's Bazar [9, 10, 11]. Additionally, no major difference was found in terms of income of dry fish producing communities between Nazirartek and Chitapara [10]. Their housing pattern was very poor and they did not have access to safe drinking water. They were unable to have proper treatment for any illness or disease. Similarly, Kubra et al. [9] and Mitu et al. [10] found indigent health condition and unreliable housing in dry fish producers of Kuakata and Cox's Bazar. Ahmed et al. [8] observed insufficient health facilities in small scale Hilsa fishers. Contrarily, fishermen community in the Sylhet Haor regions reported to have over 70% literacy rate, <20% sanitation facilities and >90% electricity availability [12]. In the Sundarbans mangrove forest, Mozumder et al. [13] observed that in spite of increased income of fishers over the years, their livelihood condition did not improve. In contrast, wholesalers had comparatively higher income than the fishers due to higher wages and societal stand. As a result, they can access better treatment facilities, nutritional food and can educate their children, thus are able to overcome the socio-economic crisis threshold. On the other hand, with an unstable income source, the fishermen and labors are unable to have savings, proper treatments or educate their children. Therefore, they end up having to take loans from wholesalers or NGOs. Due to the differences in income, the socio-economic status between fishermen and wholesalers is discrete. Corresponding to our results, Billah et al. [11] also concluded that levels of family income correlates with their economic condition.

The present study validates that fishing experience, income and age of fishers are all interconnected to each other, with significant correlation between age and fishing experience. It was observed that older fishers (>40 years) had comparatively smaller wages with less experience, while young fishers (<35 years) with more experience had more income and experience than middle aged labors. In contrast to the fishers, wholesalers had more experience and therefore their annual income was more, despite their age. Thus, fishers aged between 20 and 40 years were commonly associated with dry fishing activities. Kubra et al. [9] also observed highest age category between 21 to 40 years in

Kuakata and Barisal. Another study conducted by Mitu et al. [10] reported similar results with 30-40 years' age group in Nazirartek and Chitapara. Aside from Bangladesh, highest age group categories of 31-40 and 41-50 years was found in James Town fishermen community of Ghana [14], while 20-30 years was common in Beeng Laut Island fishers of Indonesia [15]. Paul et al. [16] explained the reason for this disposition is because the age group between 31 and 40 is common in fishing activities and are considered more active.

While conducting the study, many limitations and problems could be identified in the fish drying communities in Nazirartek. The low wages of fishers led them to have poor food security and malnourished lifestyle. They could not have proper meals three times a day without access to food security and sanitation. On top of poverty, the fish drying communities face a great deal of bad weather condition in the coastal areas including storms, cyclones and erosion. The activities of fish drying were highly dependent on environmental conditions. Due to their vulnerability to extreme weather conditions, the fish drying communities face several socio-economic obstacles for sustaining their livelihoods [10]. As drying activities are seasonal work, one of the limitations was that the fishers did not get enough reimbursements during the off seasons and so they had to take extra labor intensive workload. Mitu et al. [10] also reported similar observations in Cox's Bazar.

Present fish drying activities in Bangladesh revolves around traditional drying techniques with no modern facilities, training opportunities or appropriate funding for the communities involved in the dry fishing industry. In most cases, the dry fishers and wholesalers lack proper training and do not maintain hygiene protocols in producing good quality dry fish products. As a result, consumer demand and market profit for dry fish is declining. Hence, it is important to focus on the development of the socio-economic dimension and livelihood status of fishers and wholesalers of the fish drying communities in the coastal areas. The Government, NGOs and local authorities should provide training and facilities to the fishers and wholesalers in order to improve traditional fish drying techniques and at the same time maintain public health.

## 5. CONCLUSION

Bangladesh has great potential of becoming one of the widespread dried fish producing country in

the world with its' various marine fisheries resources, competent weather, long seashore area, capable fishermen and dried fish producers. Several stakeholders such as-fishermen, labors, dried fish producers, wholesalers directly or indirectly play a role in the supply chain of dried fish producing community. The livelihood of fishers and wholesalers depend on a combination of socio-economic and educational factors. Although the living mode of wholesalers is better than the labors due to societal status, financial and technical stability, there are still so much to improve in the dried fish producers' community. The labors should be compensated sufficiently during rainy seasons, their employment opportunity in other agricultural fields as well as proper education system should be guaranteed. The transport conveniences and financial support from banking sector are other factors that should be considered for further development of livelihood. The characteristics and significance of this sector should be considered as a priority because of its' extensive role in production, preservation and food safety. The government should take necessary steps to solve economic complications through various government support systems and pertinent policy interventions. Support from expert health personnel and implementation of modern infrastructures through extension services can improve their living standards. The socio-economic, educational, health and nutritional status of the stakeholders in dried fish producing communities should be boosted sustainably with the help of extensive research, institutional, organizational and government support.

## ACKNOWLEDGEMENTS

The authors would like to acknowledge local fishermen community and fish market personnel for their kind assistance during sample collection.
